

Top performance for every application – the Punta family is complete

The extremely flexible pivot radius and high energy efficiency of the Punta series models are just two of the reasons why they're the shining stars of recessed luminaires. Ansorg has now rounded off the successful Punta family to include products for all customer requirements. All the four models in the current series feature the same extraordinary flexibility. A ring bearing makes an infinite 360-degree rotation radius possible. The Punta luminaires also have an impressive pivot radius of 0 to 70 degrees. They are suitable for downlight applications and also for precise spot lighting up high on walls or peripheral areas to effectively showcase high decorations. Punta luminaires are all fitted with low-glare reflectors with optimised exit angles in terms of 'Return of Light' for the efficient illumination of the target surface with strong directional light.

During the development process Ansorg particularly focused on performance and efficiency. The result is a series of luminaires with outstanding light output that are among the most efficient in their classes. The Punta luminaires are also best in class in terms of system efficiency.

The use of premium materials has made it possible to considerably reduce the weight of the Punta series products and, as a result, they can also be installed in less robust ceilings. The Punta models PXR, PSR, PMR and PLR come in all relevant market sizes from mini to large, and can be quickly and easily installed in standard circular apertures of between 95 and 185 millimetres. Punta – powerful light, fast installation.
